

The Truth

Is it true that the simplest explanation is usually the correct one? What follows is a simple explanation of Nature and everything in it, including perception. And, the solution.

Introduction:

We can begin by accepting that the Truth exists outside the current realm of Human perception, and that current human perception is limited to a reality that has evolved through competitive interpretation. Since competition is deception, our current perception of reality has nothing to do with Truth.

The exposure of "Truth" will mean that everything must change. For, there can be no coexistence of Truth and deception. Therefore, no place for competition. And, we will all see everything differently, including ourselves and each other. Competition will be replaced with compassion and cooperation.

The most important thing here is that you be willing to seek to identify the difference between that which is True and that which is false. Not easy to do since it will mean questioning your own identity. However, the future is depending on it. Can you develop genuine wisdom and be true to yourself? Can you accept that everything you have been told about Nature, and how it works, is based on competitive interpretation and therefore, not true?

In order to understand the Truth, we must be able to understand Nature as it exists in reality. For, if we understand Nature, then we understand perception, and how it works relative to Nature. This is the key to our survival into the future. Though the understanding of Nature is relatively simple (you need only to comprehend the concept of "Motion"), we cannot understand perception without understanding Nature. The problem for us to understand any of it, is that all of Nature is based on variations of relative "Motion", and perception itself is based on the relative absence of motion. Meaning, perception for us is based on language and mathematics which has nothing to do with Nature. In other words, we must shut Nature down in order to formulate images in memory, based on words. This is limiting.

Our pathway into the future requires that each of us develop the ability to be true to ourselves. Meaning; to seek the truth for what it is. For, if we are true to ourselves, we are true to fellow man. We should begin by redefining the word

“evil” as “the absence of truth”. For, every evil thing that has ever occurred has occurred through the absence of truth. Currently, it may seem unrealistic that each of us can be true to ourselves. However, it is only because we haven’t learned yet.

The revelation of truth is going to explain everything. It starts with a simple and brief explanation of “Motion”, which is used as the foundation for the explanations of everything else. Next is the explanation of “Matter” which, if we are “True”, should alter our current perception of reality. Next is a simple explanation of “Optics”, which is used to validate every aspect of this entire explanation. Next is the explanation of “perception and purpose”, which is far more involved because, like everything in Nature, it involves a multitude of activities simultaneously, and I must use language to explain it. Again, language is only relative to the limitations of Human perception, and has nothing to do with the realities of Nature.

The explanation of “perception and purpose” is going to bring to light a great many things about us. Namely; why we think the way we think, and value the things we value (individually, and collectively). Once understood, everything will change. However, to get there, we must have a reference as to what is real, and what is false.

The understanding of “Motion” will lead to the understanding of “Matter”, and how the “Earth”, “Moon”, and “Sun” were formed, and how they continue to evolve. These things have nothing to do with “atoms”. Since “atom” is only a word, created by man, through the absence of true understanding. As you become familiar with Nature, and how it works, you will see that the concept of “atoms” makes no sense. Without the existence of “atoms”, grand achievements of mankind such as space travel, nuclear weapons, and many other claims are shown to be false.

Most important is that everything included in this entire explanation can be confirmed as valid through the simple explanation of “Optics”. Optics is the most dominant aspect of perception, and can be used to connect everything else. For example: Optics will show that “light” does not travel, and there is no such thing as “light” as a separate entity in Nature. The explanations of “optics”, “perception”, and “motion” will show that all things are variations of the same

thing. Therefore, “light”, “sound”, etc., are only relative to the limitations of perception, and do not exist as separate entities in Nature. We separate them through the necessity of evolution (survival).

Optics will show that what we perceive as light is reaction to perception, through optics, of variations of relatively violent activity of environment at surfaces. Always at surfaces because this is where the greatest differences in environment exist and therefore, the most violent reactions. Always at surfaces, and always at “relative angles of exposure”. No exceptions. Entire environment is involved, and it is always a simultaneous reaction. Optics can be used to explain “Radio”, “wireless communication”, and other violent activity of environment which will lead to explanations of many modern health issues such as, cancers, neurological problems, birth defects, and many other issues.

The continued explanation of perception and purpose will include the simultaneous evolution of emotion, which is based on the identification, grouping, and comparison of every aspect of environment, and which is based on the assigning of relative “value” to every aspect of environment. For, there is nothing in memory that is not connected to some variation of relative value. For, environments everywhere are filled with variations of relative value, and nothing else. With no true reference to collective purpose, other than the frenzied quest to achieve a perception of relative value, it was inevitable that we evolved to our current state of turmoil.

Lastly; there is a solution. The solution does require that each of us strive to be true to self. We must identify the true difference between good and evil. We must be willing to accept the significance of what we are currently doing, compared to what we should be doing.

Mankind has achieved a great many impressive things, relative to current perception. However, as we learn about Nature, we come to understand that these “impressive” achievements aren’t very impressive in reality, and are the cause of our decline. Because, they cause us (collectively) to perceive that we are on the right track. These achievements are nothing compared to what we should have.

Our solution is simple. Especially since it involves every one of us. The challenge is the transition, and how we bring everyone on board, while retaining stability. However, it should be fun. For, who would reject “love”?

The explanation of the “Solution” does include explanations of “religion”, sex and reproduction without competition, how to handle rogue individuals and groups without revenge, and how to make a successful transition.

Nature

There is only one clue to the reality of Nature that is available to perception. That is; all things are in motion relative to all other things. Now, we allow simple logic and common sense to carry us the rest of the way.

All things are in motion relative to all other things. We know this to be true through the simple understanding of “motion”. “Motion” as defined in English, is “the action or process of moving or being moved”. However, the definition leaves out the most important aspect of it. In order to have motion, you must have difference. Difference in relative pressure. Meaning: something moving is being pushed in the direction of relative vacuum. Therefore, “Motion” can be redefined as pressure/vacuum, or vacuum/pressure.

It is also true that if motion exists anywhere in Nature, it must exist everywhere. It wouldn't make sense that motion could occur and someplace else, stagnation, or the absence of motion. If motion exists everywhere then difference must exist everywhere. Difference in relative vacuum/pressure. This means that everything everywhere is continuously changing, and nothing anywhere is ever the same from one instant to the next. This is important because it says that equalities do not exist in reality, and mathematics and language are only relative to the limitations of human perception. This will be very clear to you when we get into the explanation of perception. In the meantime, we can say that the “Universe” and everything in it is made up of “Universe” under variations of vacuum/pressure. And, everything is connected to everything else.

Note: 1. It is important to remember that relative pressure is always contained by environment, and you cannot have relative ‘motion’ without containment. This should be enough to explain the impossibility of “space travel”. If this is not enough, the explanation of ‘matter’ should leave no doubt.

Note: 2. Even the words “Universe”, “Nature”, and “Motion” are man-made. I am limited by the necessity to use language to explain this, and Nature has nothing to do with language. However, the limitations of human perception have everything to do with language.

Matter

What man calls “matter” is variation of universe under enhanced variation of vacuum/pressure.

Since motion is everywhere, and motion implies differences in vacuum/pressure, it is obvious that the potential exists for ‘relative drag’ to occur, throughout. “Relative drag” is a disruption of uniform flow which can generate “eddies”. It should be obvious that the “Sun”, “Moon”, and “Earth” were all formed in “eddies”.

In all cases, every aspect of an eddy is drawn inward, toward the center. However, nothing lasts forever. In other words, pressure is either building, or dispersing. Nothing stagnates. Therefore, in order for relative vacuum to be retained toward the center, it must have some place to go.

By the time material from our 3-dimensional eddy has reached the center, it has compressed, and is mixing with highly active center environment. Such a highly active environment can only accommodate so much pressure. Therefore, variations of pressurized mixing environments must be forced outward. As these highly pressurized mixing environments are progressively forced outward, they are continuing to mix with new, less pressurized environments, and have become a part of new environment, progressively. The less pressurized environment continuously mixing with highly pressurized will generate relative vacuum. It is this process that is the formation of “matter”.

As long as relative vacuum exists toward the center, and material from eddy is drawn inward, “matter” will continue to form and be forced outward. This will explain earthquakes and volcanoes, and suggest that the Earth is expanding.

It is obvious that the “Moon” was formed under similar conditions, and has since used up the material of its’ eddy. The moon is currently caught in our eddy,

and is in a relative state of decay. Meaning; it has boiled from inside out, and since there is now, far less activity, it has taken on a crystalline like characteristic which would produce the perception of “white”. It is certain that a similar fate awaits the Earth. It is also certain that with our collective ability to anticipate this, we needn’t panic.

It is likely that the presence of the moon without its’ eddy, created drag, and was the cause of the formation of our own eddy.

The “Sun”, relative to its’ eddy, is doing what the ‘Earth’ is doing, and what the ‘Moon’ has done. Accept, with a greater variation of relative activity throughout, and at its’ surface. The “Sun” continues to grow. It is the volume of this activity that generates simultaneous reaction throughout. The Sun will use up its’ eddy, reduce its’ internal activity, decay, and revert back to “Universe” under variation of relative “Motion”.

Note: The “Earth” and “Moon”, being caught in the “Sun’s” eddy, are being drawn toward the “Sun”. The “Climate” here will continue to change.

Asteroids, Comets, and Meteors:

There are no “asteroids”, “comets”, or “meteors”. There is nothing flying around independently in “space” slamming into things. There are always variations of relative motion which have the potential to produce “drag”. When “drag” occurs relative to our perceptive environment, surfaces are formed which would generate high activity in the way of mixing environments (“light”). “Northern Lights” are another example of relative drag. A 3-dimensional eddy would indicate that the greatest variation of activity would exist toward the center. In this case, it would be toward the poles.

Gravity:

By now, it should be obvious that there is no such thing as “Gravity” as a separate entity in Nature. There is, variation of relative vacuum/pressure.

The formation of “Matter” involves the entire environment of our eddy, simultaneously. As the material is pressurized near the center, and forced outward progressively, it continues to mix with environment which is being drawn inward, and which is less pressurized, progressively. The further away from the center that

it is pushed, the less pressurized the environment, and the greater the difference between new less pressurized environment and pressurized material. A relative vacuum will exist as the material mixes with the vacuum of the environment being drawn inward. The material will continue to expand relatively, progressively, to accommodate the absence of pressure.

The variation of material that reaches the surface is continuously mixing. It is this continuous, 3-dimensional mixing, from inside and out that causes material to retain its' relative form, and be drawn inward. The further away from the surface, the greater the expansion.

All things are what they are as the result of their environment (this includes us). If you move anything from one environment to another, it will change and adapt to its' new environment. If you take something from the surface here, and try to place it far above, it won't hold up. It'll become something different. Space travel is impossible for us.

Momentum:

Try throwing a stone. As you apply initial pressure from your arm, you excite relative environment, relatively. You cause expansion of the environment which must continue to adjust. The stone continues to mix with the continuously adjusting environment. Nothing is independent.

Submarines:

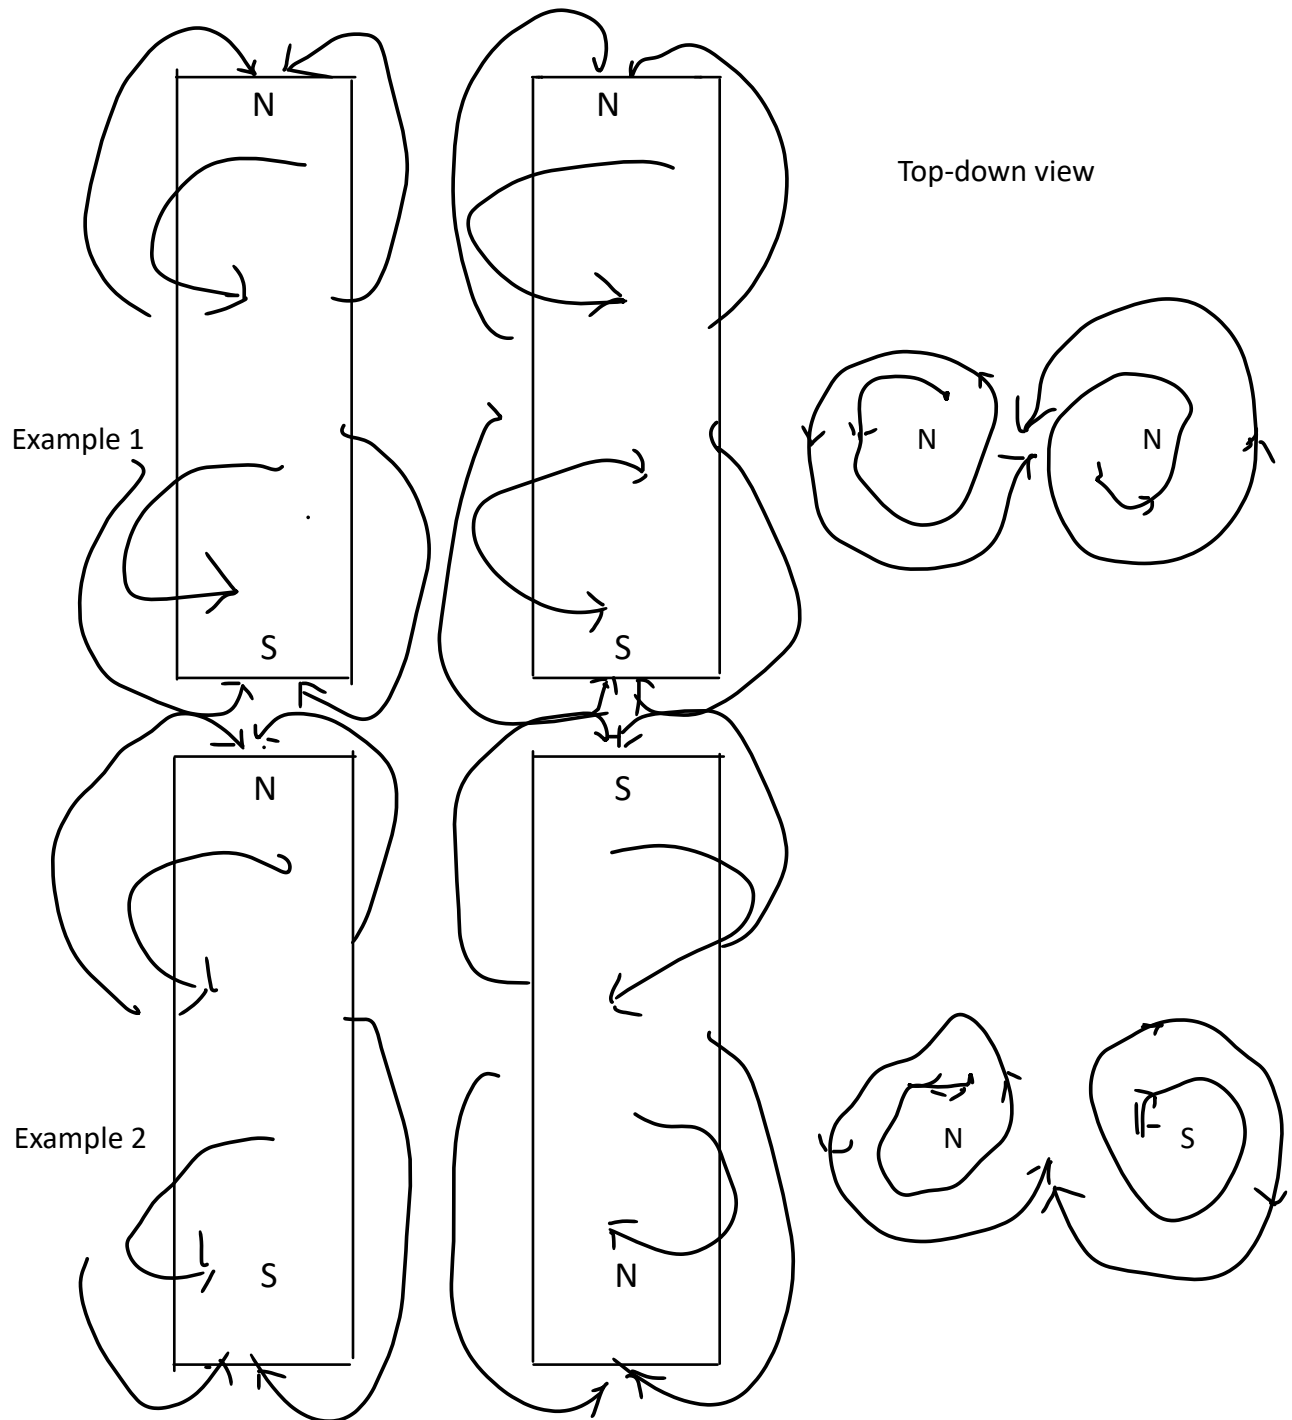

Submarines and the like are very limited as to how deep they can go, for obvious reasons. The further from the surface, the greater the pressure. In order to force something through it, you must displace what is there. How can that be done? Nothing can sink more than a few hundred feet. Not even "lead".

Dinosaurs:

Mankind loves to fabricate and create something to sell in order to elevate a perception of relative value. In a viciously competitive environment, the fabrications become more and more removed from reality. For, there is no place else to go. The problem is, that all of World adjusts to these fabrications as they become our new reality, and collectively, we evolve further from truth, and further from an ability to solve real problems. No such thing as dinosaurs.

Magnetism:

Bar magnets would involve spin and heat in their formation (eddy) similar to that of Earth.

The formation of magnet is a fine example of how Nature functions. As the 'bar' is consumed with violent activity in the way of 'heat', all aspects within are adjusting (vacuum/pressure) to all other aspects within, and simultaneously adjusting with all of environment involving 'spin'. The spin, whether of 'bar' itself, or its' environment, must continue while the 'bar' cools. Once cooled, the magnet continues to adjust to all aspects within, and with all aspects of exterior environment.

Example 1 above shows the reaction when two bars with the same direction of spin, during formation, are placed next to one another (relative pressure).

Example 2 (relative vacuum).

The explanation of 'magnetism' provides another reference as to the formation of 'matter', and its' tendency to be drawn inward ("gravity").

It is important to remember that everything in the "Universe" has a Natural tendency to adjust to difference. Vacuum will always draw in environment until it is no longer vacuum, at which point, it becomes some other variation of relative motion. The point is; all aspects of 'matter' will adjust to whatever is going on with its' exterior.

Electricity:

Electricity is the violent disruption of relative vacuum/pressure brought about by elevated activity (elevated vacuum/pressure). In every case, it involves reaction generated by opposing variations of vacuum/pressure. See example 1 of magnetism. In every case, opposing variations of vacuum/pressure will generate elevated vacuum/pressure relatively, which must have some place to go.

Copper, like all "conductive" material is made up of relatively uniformly pressurized "Universe". Like all things, relative uniformity requires that all aspects within adjust uniformly to all external variations of uniform vacuum/pressure. Therefore, conductive wire that is exposed to external activity such as turbine, magneto, or battery, will react violently when such exposure is relative to opposing vacuum/pressure through a completed connection (completed circuit). The violent reaction in the way of elevated activity (elevated vacuum/pressure) must have some place to go, i. e. appliance, "light", etc.

Note: 1. The absorption and relative discard of vacuum/pressure within the substance occurs throughout, and is simultaneous.

Thunderstorms are the result of opposing variations of vacuum/pressure. Varying aspects of environment under varying directions of relative motion (spin) will take on different variations of relative vacuum/pressure. It is when these different environments connect that violent reaction occurs by way of “lightning and thunder”. For, it is the “overload” (relative difference) at the point of connection that all aspects adjust to, relatively, and simultaneously throughout.

Note: Sound does not travel. See Sound: Pg 16.

Optics:

A tree (like everything else) has potential to generate reaction to perception through all senses. For example; “sight”. Remember that there is preexisting connection between perception and all aspects of environment. Whether “light” is present, or not. When “light” is present, it is because entire environment is simultaneously adjusting to elevated activity in the way of violent vacuum/pressure. The source could be “sun”, “fire”, “electrical”, etc. In any case, it has nothing to do with “light” traveling. Even though, light traveling, has always made the most sense to us. The simple fact is; entire environment is already adjusting to differences because nothing in environment is the same. “Light” is simply a violent elevation of difference in the way of vacuum/pressure.

Picture a brick of Jello on a plate on a kitchen table (the brick representing environment). If you touch any part of that brick, entire brick reacts relatively, simultaneously. Now, if you were to move the plate across the table, you would notice that every aspect of that room is altered relatively, simultaneously. The relative distances and “relative angles of exposure” have changed relatively and simultaneously throughout. Entire environments outside that room and beyond have been altered relatively and simultaneously as well. No traveling of anything and no delays. The idea that “light” travels by wave, or particle, or anything else, makes no sense.

Note: The Thomas Young “double slit experiment” of 1801 can be used to explain away the theory of “wave particle duality”. It can be used to confirm that “light” does not travel, and is a simultaneous reaction.

A tree that is perceived through optics has reacted, and generated simultaneous reaction, relative to elevated violent activity of entire environment. Relative to optics, the greatest differences in environment always occurs at surfaces. This includes the surfaces of the tree, and the surfaces of “optics”. This is why “relative angles of exposure” are so important. For, this is where the greatest variation of relative pressure will exist.

Notice that water and air are clear, relative to optics. However, we can detect water droplets, snowflakes, whitecaps, clouds, eddies, blue sky, and specs of light in the night sky. In each case, it is because surfaces are involved, and it has nothing to do with “reflection”. It has everything to do with the fact that entire environments are involved simultaneously.

Note: Specs of “light” in the night sky are not “stars”. This is another misperception.

Water droplet (like everything else) is made up of multitudes of variations of relative vacuum/pressure. It is the interaction of excited environment mixing with the interaction of excited water, and the simultaneous interaction of excited perception through optics that generates reaction to memory. The water droplet cannot be detected without all surfaces of the droplet reacting and generating simultaneous reaction relative to all other surfaces. The surfaces alone are what generate the reaction to perception, because this is where the most dominant variation of relative activity occurs, due to the relative differences of environments.

Ice is clear except for all surfaces. The high activity of the multitudes of surfaces of ‘snowflake’ reacting and generating reaction relative to one another is what generates reaction to perception in the way of color (white). Very similar to that which occurs with ‘whitecaps’, and ‘clouds. ‘Eddies’ can be perceived in water and air because eddies generate the greatest level of vacuum/pressure (activity) at surfaces. Since the Earth and Sun are contained in “3-dimensional” ‘eddies’, the outside surface is what generates the colors of the ‘rainbow’ (predominantly blue) similar to that of water droplet. The specs in the night sky are caused by the outside surface of our eddy reacting and generating simultaneous reaction relative to all surfaces, and relative to the absence of direct Sun exposure.

Note: Telescopes are limited because such surfaces will always generate distortion relative to optics. We cannot see beyond our own 'eddy' with any degree of accuracy, And, because the curved surfaces of a lens do not "magnify". They only allow perception of a focused object at multiple angles simultaneously. Again, it is the result of "relative angles of exposure".

Perception evolved to separate and identify multitudes of uniformities of relative activity of environment. Perception, through optics, reacts to fairly specific variations of activity by way of color. Examples of this are rainbow, and prism. In both cases, relative uniformity of surfaces is necessary. Because, it is the interaction of all surfaces simultaneously, combined with the simultaneous interaction of excited outside environment that creates the simultaneous perception of relative color. In all cases, "white light" is not broken down into separate colors. It is the simultaneous adjustment of mixing environments at all surfaces that alter the relative activity. It always involves surfaces that are angled away alternately, mixing with the absence of relative angle, or flat surfaces. Therefore, it is the inconsistent reactions at these varying angles that produce the effect (color). SEE PRISM pg.15. Notice that a rainbow-like effect will not occur through anything other than a relatively clear and uniform substance. Although, the colors of the rainbow may appear independently on broken or rough surfaces. Again, relative angles of exposure are always involved.

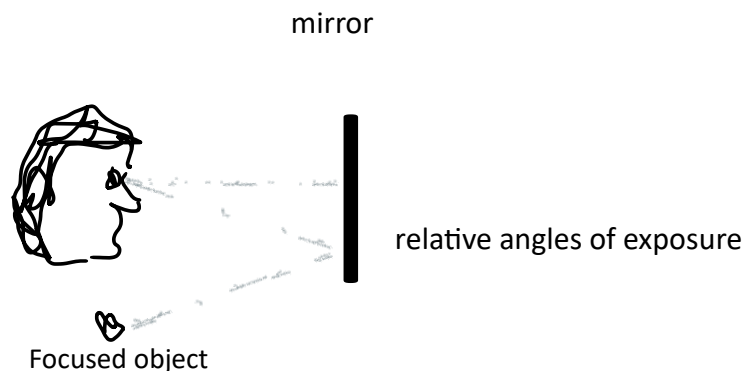

Keep in mind that there is no such thing as "color" in reality. It is all a perceptual interpretation.

"White" (like all colors) is the result of the activity of mixing environments. Through mixing environments, "white" is the production of relatively high activity between optics and focused object. Conversely, "black" is the absence of relative activity between optics and focused object. All other colors are directly associated with relative volume of activity. Note that "black" implies volatility due to containment of activity, and "white" implies the relative absence of containment. All other colors are relative. See Fire and Color pg.18.

Rain droplets are perceived because all the surfaces are interacting with all the surfaces of entire environment, simultaneously. Since the droplet is in motion, the relative angles of exposure are never the same from one instant to the next. Perception reacts due to the relative activity generated through optics.

Optics continued:

Look at yourself in a mirror. Notice that the reaction to optics is always based on “relative angles of exposure”. Angles of exposure, relative to the eye and focused object, is where the greatest variation of pressure has occurred. If you divert your eye away from your mirrored image, or slightly alter the angle of the mirror, the image detected through optics will exist at relative angle of exposure. Even though, there are a multitude of other things occurring in the environment.

This is important because we can now show that light does not travel.

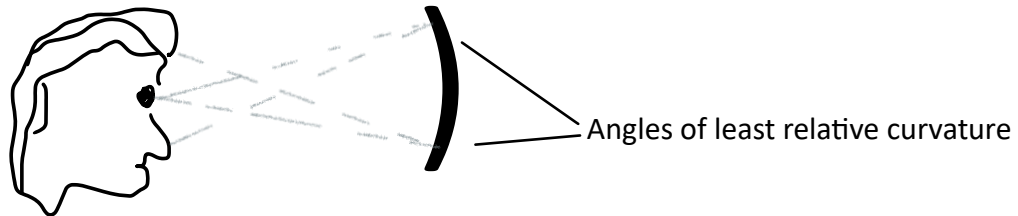

We should remember that perception is not equipped to comprehend all activity that is occurring in environment simultaneously. It is only equipped to bring into focus that which perception can accommodate, and it should be our collective purpose to evolve out of such restriction.

Now look at yourself using a curved surface such as a smooth spoon, or a magnifying glass. Notice that your image is inverted. Not only from top to bottom and bottom to top, but from side to side as well. Again, perception through optics

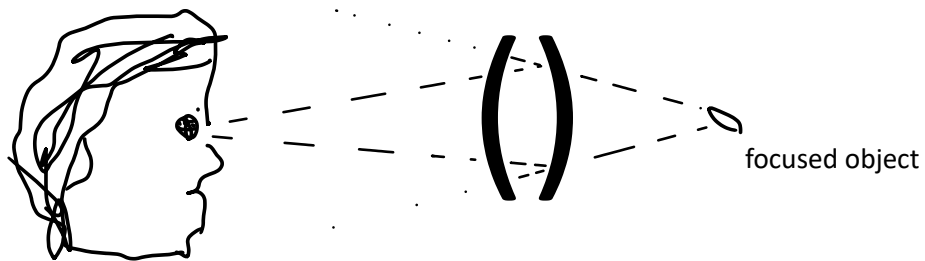

always occurs at angles of least relative curvature which occurs at relative angles of exposure.

Not to scale

Spoon

Now let's look at a magnifying glass

Relative to perception, the inside surface is reacting to the focused object, the outside surface, and eye, simultaneously.

What we are seeing is not “magnification”, but the focused object at multiple angles simultaneously. Notice that only the surfaces react and generate simultaneous reaction relative to one another, eye, and focused object. Remember, surfaces are where the greatest differences of environment exist, and therefore, the most violent adjustment, based on activity.

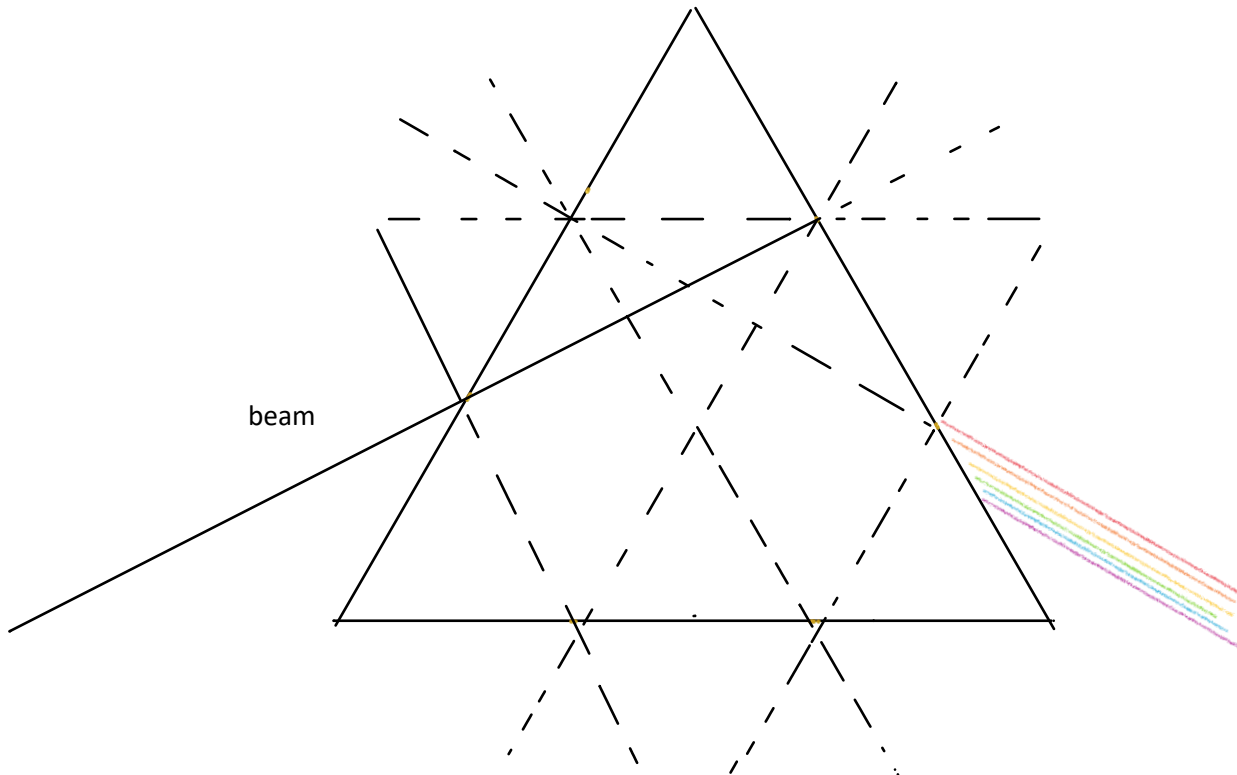

You can see this throughout your environment. Even a pair of glass has 2 surfaces, and generates reaction at both surfaces.

Prism:

not to scale

Notice that the beam spreads and alternates at the surfaces 6 times (6 colors). Notice too that red is spread least, and violet is spread most. Also, the 4

“intersections” between the surfaces are likely to have some influence since the activity generated at these points would likely produce some variation of surface (mixing environments).

The surfaces of the prism react and generate simultaneous reaction relative to one another. Light does not break down. Each angle of exposure generates different simultaneous reaction. This means, the activity at each exposed angle is altered. The different variations of activity (vacuum/pressure) are what perception reacts to through optics, in the way of color. Color is variation of activity, strictly for the benefit of perception. This is how perception separates variations of relative differences of activity in order to identify, group, and compare, for the purpose of assigning associated value.

Like the prism, we can apply similar logic to the understanding of water droplets (rainbow). When you are driving on a road and you see a rainbow in the

distance, notice that as you are moving along, the rainbow moves also, relatively. In fact, if there are others in the vehicle, they may see the rainbow at a slightly different angle. The rainbow might not be present relative to a vehicle ahead of you, and even behind you. It depends on the field of water droplets, source (Sun), and optics, and how they line up at relative angles of exposure. Without perception, the rainbow does not exist. However, reaction to environment of relative vacuum/pressure will exist.

Radio and other such activities in environment will react similarly to the previous explanation of optics. Relative angles of exposure and angles of least relative curvature at surfaces are always involved relative to perception. However, the same rules apply throughout environment, whether it involves perception or not. Nothing is independent of environment, including radio and other man-made activities. Bone and other aspect of body provide surfaces that will react to activity of environment. Surfaces react and generate different simultaneous reaction to all other surfaces. It should be no wonder that we have a multitude of modern health issues that we can't fix.

Sound:

“Sound”, like “light”, dose not travel. Even though, it seems obvious that it does.

Does a tree falling in the woods make a sound, if nothing is there to hear it? The answer is no. Sound is only relative to perception. A tree falling does generate reaction throughout environment. It is a violent disruption to that which is already present. Sound is perception, through hearing, of relative activity of environment. Since all things in environment are connected, and all environments are connected, it is a simultaneous reaction. However, what man perceives as air is volume of Universe in motion. It expands and contracts based on the introduction

of relative vacuum/pressure (activity) from either inside its environment, or outside. If activity in the way of sound occurs relative to environment and perception, and there appears to be a delay, it is because perception has evolved to react to specific aspects of activity (relative angles of exposure). Which means, violent activity from a distance will cause its environment to expand 3-dimensionally, accordingly. An expanding environment has altered relative angles of exposure. It is only when environment readjusts back that the activity is such that will cause reaction to perception through hearing. In some cases, the sound can be perceived as echo.

In the case of echo, an expanding environment, due to activity, will expand into environment only relative to environment's ability to accommodate such expansion. In the meantime, environments which are expanded into are contracting, simultaneously, and the environment at the initial point of activity has become vacuum, simultaneously. All environments must readjust. It is similar to that of air and water (waves). In the case of echo, environments are contained. Activity (vacuum/pressure) generated from a source, will alter vacuum/pressure of all aspects of that environment simultaneously. This activity is enhanced relative pressure and will cause expansion of environment relatively. Therefore, all relative angles of exposure will have been distorted. In a contained environment, expansion will occur only to the point of containment, and then, continue to expand in the opposite direction until it reaches another point of containment and continues in its' opposite direction. This will continue back and forth until entire environment adjusts back to the relative absence of activity. In the meantime, vacuums are formed and filled from opposing directions and relative angles of exposure reach the point of perception through hearing. The more uniform the containment, the greater the gain (clarity). No "sound barrier".

Water and Air:

Volume of universe in the form of air that is pressurized takes on more weight. The reason is, all aspects of that pressurized volume must continue to adjust to all aspects of outside environment which is still in motion (gravity). Again, pressure is retained only relative to environments ability to contain. Volume must continue to adjust to activity, inside and outside.

Toss a stone into a calm pond. The force of the stone contacting the surface is pressure causing the water to displace. Since the environment of the water is relatively contained, except at its surface, the contained environment of water causes the displacement to be relatively uniform (circle) and away from the point of contact. As the displaced water is forced up and away, it sets off a chain reaction. The air above is displaced directionally, pressurized, and takes on more weight. The weighted volume of air forces another displacement of water directionally, which displaces the air above directionally, and so on.

Turbulent surfaces of water (storm) are reacting similarly to the vacuum/pressure aspects of environment. Turbulent air causes displacement of water which causes displacement of air and so on.

Fire and Color:

Fire is violent displacement of environment. Meaning, environment must absorb the material that is altered from its relative state of fuel. Fuel is made up of compressed volume of universe under variation of relative vacuum/pressure which is constantly adjusting itself relative to differences inside and outside. When you strike a match or cause a spark, you have altered entire environment simultaneously, and all aspects must adjust relatively. When you put a lit match to a volatile substance, you cause a chain reaction by altering the vacuum/pressure that is necessary for the substance to retain its form, and entire environment must adjust simultaneously. As aspects of substance mixes with environment, violently, its immediate environment reacts accordingly, and so on. The violent adjustments, based on differences of relative vacuum/pressure of inside and outside environments generate violent adjustment throughout environment. Perception reacts to this activity through all the senses. Taste is dependent on substance. Heat is always associated with violent activity and expansion of environment.

Think of a tree and the volume of Universe it takes to make up that tree. Consider bucking and splitting the tree into firewood and burning it. As the tree is converted from its initial form (by burning), it displaces environment accordingly, relatively, and environment absorbs the volume of universe in its different form.

At the source of conversion, the activity is violent enough to generate reaction to perception by way of color. Sometimes, the colors of the rainbow are associated with the conversion, plus black and white. Black implies volatility. In

most cases, the substance is first turned black before it is converted. The activity from outside is absorbed inside and does not produce activity outside, adequate for perception. Black (relative to optics) is the absence of relative pressure, outside. White is the opposite and shows up as smoke and ash. It does not contain relative pressure (inside) and therefore, generates non-distorted, or pure reaction to perception through optics. Red is a contained mixing environment (from black to red). Orange, then yellow are progressively less contained, producing greater pressure relative to optics (greater activity). Green, blue, then purple is progressively more contained. All colors relative to optics implies the presence of surfaces producing high activity of mixing environments.

Note: Black, inside or outside a living body will react more violently to outside activity, such as electrical transmission, etc. This is a cause for health issues, such as cancers and many others.

Perception

Beginning:

In the beginning (before perception), all environments were filled with aspects of 'nature' continuously adjusting to variations of difference. Eventually (without the existence of time), certain aspects or aspect continuously retained 'relative form' in spite of continuously changing environment. Eventually, an aspect adapted the ability to anticipate changing environment and adjust accordingly. This would be the dawn of perception and purpose. Purpose being; the retention of form through changing environment (survival).

All aspects of Nature are connected to all other aspects, and nothing is independent of environment. This means; as any aspect of environment is altered, all other aspects are altered relatively, simultaneously. No matter how minute, and elusive to perception. Therefore, initial aspects of life were never independent of environment, but were integrally connected. As such; initial aspects had to evolve relative to evolving environment. And, since life does not stagnate, growth implies the presence of relative vacuum. However, like all things in Nature, pressure can only build to the extent that environment will

accommodate. At which point, that pressure disperses and becomes relative vacuum. It is likely that initial aspect of life reached a point of growth that it could not accommodate, and therefore was forced to split while retaining the ability to anticipate.

Note: 1. It is likely that “life” began at a single “point”, which would mean that we are all related to everything that has ever lived (here).

Note: 2. All of life, no matter how primitive, must have purpose, or it cannot survive.

In order to perceive and anticipate through a changing environment, abilities to anticipate had to change. Perception had to evolve to separate aspects of environment through the “identification”, “grouping”, and “comparison” of relative uniformities. Uniformities being; relative similarities of vacuum/pressure. This was the formation of memory. In order to identify those aspects that were useful, compared to those that were harmful, the development of memory included the simultaneous development of emotion, which is always based on the assignment of relative ‘value’. Emotion is variation of relative vacuum/pressure applied to variation of relative value assigned to images in memory.

Variation of pressure applied to the substance of memory, based on emotion, is applied throughout, and is a physical alteration, and is always based on “relative angles of exposure”. The “relative angles of exposure” allows for the retention and access of multitudes of images.

We “identify”, “group”, and “compare” everything. For, this is the foundation of perception. The word “group” is important here, because in order to formulate images in memory, perception must react to relatively specific variations of “motion”. This means; activity in environment that is uniform enough (similar enough) to allow for perception to react through the formation of image. In order to achieve this, perception must STOP Nature. It must discard the activity, and bring into focus, an image i. e. “tree”, “rock”, “water”, “light”, etc. Even though, there is always continuous activity, and nothing anywhere is the same, and everything is continuously changing from one instant to the next. This aspect of perception is strictly an evolutionary necessity, and is the cause of our deviation from reality. Because, it causes us to separate all aspects of environment, when in ‘Truth’, everything is connected. Perception and Nature are a contradiction. ***

The word “compare” is important because it causes us to separate images that have different assigned relative value. This allows for perception to function. Everything that we identify is automatically, and simultaneously compared to everything else that is not that image.

The identification, grouping, and comparison, based on the functionality of perception is directly associated with a perception of relative purpose. For, purpose is the connecting function of all of perception, and we cannot exist without it. For, we have to have a reason to do what we do. Therefore, we are continuously seeking a perception of relative purpose.

Here is an example of how it works:

Again, nothing is independent of environment, and all environments are connected. Everything in body and mind is connected. In our case, we have evolved to accommodate a multitude of variations of relative purpose simultaneously (multitask). However, it isn't as though these multitudes of purpose are separate, or independent. They are all connected.

As I write this explanation, I struggle to stay ‘focused’. Even though, the successful conveyance of the ‘Truth’ is my dominant purpose. The reason for my struggle is that I exist in two Worlds. 1.The World of “Truth”, which for more than 30 years, has been familiar to me, and yet, still generates some self-doubt. 2.The World of competition which is familiar to me, and of which my own survival depends, and yet, I must continue. How can I create an environment that will allow me to successfully write this explanation? So now, a great many sub-purposes come into play. In spite of such struggle, I will do whatever it takes to achieve my dominant purpose. In this case, it means removing myself from the competitive environment of society, to a log cabin in the Alaskan wilderness. However, surviving in the wilderness brings about its own set of sub-purposes.

The conscious mind is continuously seeking purpose in order to prioritize activity. The mind is made up of variations of relative value, in the way of images, with assigned emotion (vacuum/pressure). Since the World is filled with nothing but variations of relative value, perception is stimulated by making connections of variations of relative value, whether from memory, or environment.

Survival has always been dependent on abilities to react to environment while simultaneously retaining relative form. Evolution has continuously adapted abilities to be stimulated by relatively violent activities of environment. For it is violent activity that generates the greatest relative reaction to perception. “Violent” meaning; different. Therefore, evolution of the different “senses”, i. e. “sight”, “sound”, “touch”, “smell”, “taste”, “hot/cold”, “vacuum/pressure”, provides progressive method for separating different aspects of activity. The progressive ability to ‘identify’ differences is directly and simultaneously connected to the evolution of different relative “emotion”, i. e. “fear”, “joy”, “indifference”, “love”, “hate”, etc. As with the senses, all variations of emotion come with an infinite range of vacuum/pressure, and therefore, an infinite range of relative value. All of which continuously evolve.

Purpose for us, individually and collectively, is always associated with that which holds the greatest relative value (dominant purpose). All sub-purposes are directly connected to a dominant purpose. Purpose of any variation is always associated with a quest to identify a perception of relative value. The quest always involves a variation of relative emotion.

Emotion is variation of relative pressure applied to images and thoughts in memory. The greater the pressure, the more dominant the retention. The greater the pressure, the more dominant the relative value. The progressively higher-pressure images will be prioritized throughout, and replace images of less priority. Obviously, more recent images will take priority over distant past images unless past images were formed with higher pressure. Images that are referenced will generally be accompanied by a similar emotion to that of their initial formation.

Note: Like all of Nature, body and mind can only accommodate so much activity before it must adjust to relative difference. The relative absence of activity through “sleep” allows for such adjustment. Conversely, body and mind can only accommodate so much sleep before it must readjust to absorb activity.

Our dominant purpose:

By now, it should be obvious that our individual and collective dominant purpose is the quest to achieve a perception of relative value. We must feel that

we have a legitimate reason to exist. We draw this reasoning from fellow man through comparison. Since, the functionality of perception itself is based on comparisons of relative values. This is the motivating force of our existence (individually and collectively).

We evolved to “identify” resources that would aid in our survival. “Resources” are to be valued. Since we are social, it is often beneficial to share such resources with group. It is also beneficial to sometimes compete for such resources. For clearly, someone else’s unwillingness to share such resources would generate a perception of diminished relative value toward that individual, or group. “Diminished”, relative to self. Such a perception is only relative to perception (fabricated), since opposing individuals and groups hold the same relative perception. Therefore, conflict (of sorts) will ensue, which always involves “deception”.

We evolved to be valued. To be valued by others, is security and reassurance. Reassurance that we are justified in our existence. As we are justified, we justify others. This is our only reference to existence, or, “dominant purpose”. Therefore, we do whatever it takes to be valued by group, whether through direct contribution, or competition (deception), or both.

As population increases, relative groups decrease, and the ability to retain individual relative value is diluted. Yet, the necessity to identify a perception of self-relative value continues. Therefore, since all of perception is based on comparisons of value, we automatically compare our own perceived value with those who would perceive us while automatically applying similar relative comparisons. In all cases, always seeking to identify relative position of value which is directly associated with relative justification for existence.

Our reference to relative value is the identification of elevated relative value compared to diminished relative value, and where we are held, relatively. For, the greater the value, the more justified the existence. Since we all inherently have the same “dominant purpose”, we all share the same relative perceptions. Which means; we must compete for the collective perception of relative value, and it is a continuous struggle. Because, we must perceive others as holding diminished relative value in order to elevate ourselves, while others are perceiving us similarly. Others will push us down in order to elevate themselves. Therefore, the

quest to achieve a perception of relative value through competition is our “Dominant Purpose”, individually, collectively, globally.

Note: 1. Such perceptions are fabrications of reality, and therefore, not connected to Truth.

Note: 2. Family, Religion, Work, and everything else, are all sub-purposes, and therefore, fall within the realm of our collective “Dominant Purpose”.

Note: 3. It is easy to deceive ourselves into thinking otherwise.

Competition:

Competition always comes with some variation of relative deception. For, it wouldn't make sense that we could be truthful with someone, or some group that we are competing against for resources (relative value). For without deception, we would be sharing.

Our story:

In order for us to go anywhere, or enjoy any form of true success into the future, we must be willing to accept that relative to Nature, we are nothing more than skin filled sacks of relative vacuum/pressure. And, the only thing that separates us from Nature is ‘perception’.

Because of self-deception, through the absence of true understanding, we think we are smarter than what we truly are. We have created an existence that makes sense to us, in spite of our lack of true understanding.

As mentioned earlier, our collective ‘dominant purpose’ is the quest to achieve a perception of relative value. The word “relative” here is IMPORTANT. Because, it implies a range of values from diminished to elevated.

Today, those of us who experience a sense of success, are stimulated through emotion which translates to elevated relative value. In order to enjoy such stimulation, perception automatically references relative comparison. Comparison of success, relative to the absence of success, or, value relative to diminished value. In order for perception to reference such comparison, we must fabricate and cause such comparisons to exist. We must devalue fellow man in order to

justify our own existence. Our entire lives are a continuous comparison of relative position in society.

To allow ourselves to be left behind would be to risk terror and desperation (minimal or no justification for existence). Therefore, our entire lives are spent attempting to create a perception of relative value. "Relative Value" requires that we remain within the confines of societal perception of relative value, which has always been based on competition. Therefore, since we are all in the same boat, all is far in acquiring value, including deception. In fact, deception is encouraged. For, if you can deceive me, I can deceive you. He who is better at deception wins. And wins the relative value of the defeated. Whether directly, or indirectly.

It is likely that some of us will reject the notion that we compete (deceive). It should be pointed out that if we can claim any level of relative success, such success is always at the expense of fellow man. For fellow man is our reference. Therefore, if we enjoy success, it is because we have bought into this 'Global' system of competition. It is just as easy to self-deceptive as it is too deceptive.

Now, we have evolved with no place else to go, but deception. We have a World full of people, all trying to justify their existence relative to a competitive environment. An entire Global population seeking to identify relative value. The greater the population, the greater the frenzy to be creative. To fabricate value. It doesn't matter what we fabricate, as long as we can be convincing of its' relative value. Once population accepts such fabrication, it becomes a part of our collective reality, and we move on to the next fabrication (reality).

We, has population, are always eager to accept such fabrications. Because, any elevation in perceived relative value is directly and automatically associated with our own relative value, since we are a part of the Global community. The more fantastic the fabrication, the greater its' relative value.

Note: 1. Fabricated achievements of Scientific Community are no different.

Note: 2. Many of the modern fabrications are far more harmful than useful.

Note: 3. As long as we are willing to deny fellow man purpose and value (through competition), he will react, and we will always have turmoil, and things can never get better. They will always get worse. We have no right to deny fellow man. Accept, we have fabricated the right. It is all a lie. It's just a dream.

We must realize that such a fabricated reality will lead us nowhere. For, we continue to move further from reality, and closer to destruction.

We need food, water, clothing, shelter, and most important, 'Purpose'. We need each other. To rely on each other comes from 'Truth', and no place else.

We have now evolved into a reality that has no place for Truth. For 'Truth' has no place in our current collective 'dominant purpose'. Though the Truth has been available for more than 30 years, it has been rejected for more than 30 years. The reason for its rejection is that as individuals or groups are exposed to it, the automatic and simultaneous comparison of relative value occurs. It has no value relative to a competitive existence. Since our individual and collective identity is so deeply rooted in this Global reality of RELATIVE value, we cannot take something that falls outside that reality seriously without questioning our own identity. No one wants to question their identity (individually or collectively). For, to do so would mean giving up relative value.

Now, this explanation has been made available. Available during a time of Global uncertainty. Now, it is time for us to question our own identity, relatively. For, what value an identity if it is based on a lie?

Currently, a tiny fraction of population controls the narrative for the rest of us. What I mean is, we all think we know what reality is, based on scientific achievement. And since we know so much, we must be on the right track. The problem is, we don't know anything about reality. Collectively, we think the "Universe" has been figured out, because that is what we have been told. And since it sounds so good, we accept it as reality. After all, why would they lie? Therefore, we allow this tiny fraction of population to dictate the narrative for the rest of us, because we don't know any better. In the meantime, problems continue to worsen, and all we can do is create "Band-Aid" fixes, without an ability to solve real problems. Because, there is no place for the rest of us to look for real solutions. As such, there is no place for us to go, accept turmoil, and destruction.

Note: It was inevitable that such a crisis would occur.

Solution

The solution is simple. However, it does require that we all understand the difference between the Truth, and the status quo. Those of us that don't understand the Truth must be taught, quickly. For it is critical that stability be gained, and retained.

The solution requires that each of us strive to be true to ourselves. Which means that our dominant purpose is now void of competition, and deception (evil). Our new collective purpose is love. We focus completely on making life good for our fellow "man", into the future.

Note: Once we understand the Truth, we will no longer be "Human". We will have evolved, and we will all have adapted new individual and collective identity.

Self-Truth:

Self-Truth implies that you have made a conscious decision to do your part toward the salvation of the World. It starts with your quest to seek the truth for what it is. To seek to understand Nature as it exists in reality. By so doing, you will have become an effective aspect of the solution. For, being true to yourself means being true to everything else, including fellow man. Competition, as a dominant purpose, has no place in Truth. Therefore, the only thing left, as a dominant purpose, is "Love".

Once evolved, we serve one another. We are Humbled. We seek only to make contribution, without recognition. For, we recognize that the greatest relative value is held by those who are truest to self. For, it is they who make the greatest

contribution toward the future. It does not matter what an individual was in the past. If we reject anything that does not involve truth, that is our contribution.

We seek out fellow “evolved” with open arms, and bring them in. We teach and learn, teach and learn. We allow ourselves to be brought in. We share everything.

Transition:

By now, we should realize that the successful transition here, is the most significant evolutionary step in History and Future, and we are all a part of it. We proceed with this in mind.

Since we now know how values can evolve, we now know that such a transition is possible. Even through, we all have memories filled with values based on a competitive existence. A Natural tendency to reference competitive values will exist. However, they will exist relative to a new “dominant purpose”. Our challenge is to recognize the difference between New, and Old dominant purpose. It shouldn’t be difficult for us. Again, self-truth is the key.

Our goal is to retain a sense of purpose while doing everything in our power to elevate fellow man’s sense of purpose. In other words, to strive for happiness while creating happiness for everyone else. To share the journey while leaving no one behind. This is how we should measure personal and collective success.

Once this explanation is exposed and accepted Globally, we seek each other out, and collectively do whatever it takes to gain and retain stability. This means; we eliminate any need for hoarding, or panic by encouraging sharing of everything. Simultaneously, we encourage ‘Self-Truth’ so that we can all be on the same page with this. However, it is likely that there will be those individuals and groups who will choose to take advantage, through competition (“Rogues”). Therefore, we must retain some level of force in order to safeguard stability. We should retain ‘law enforcement’, and ‘military’, but with new purpose, and without revenge. We should all aid in this. Those who won’t see the benefits of this new purpose, and reject “Love” should be removed and placed on an island where they can’t get off. There, they can finish their lives out in competition, but without the ability to reproduce. Again, revenge cannot be a part of this new purpose, and we can’t have prisons, or anything like that.

Note: The need for 'law enforcement' and 'military' should diminish as the success of this new purpose progresses.

Initially, we go to work, as usual. There, we communicate with co-workers and community to determine the usefulness of our work. This should be done on a Global scale. For, we must keep infrastructure intact, and avoid chaos. Everything must be done without 'MONEY'. For, money, wealth and power cannot be a part of a healthy existence into the future. For, these things are all fake methods of measuring relative value. We can't have ownership of any kind. Everything must be shared with "Love".

Note: We either want to make it into the future, or we don't. Which is it?

Without the need for 'money', massive Human resources can be made available to aid in this transition. Any jobs that had anything to do with 'money' can be freed up. All these people can now devote their energy toward solving problems relatively. Communication, on a Global scale is the way. Example: Collectively, through communication, we determine the best ways to retain communication while reducing its' damaging effects to our own health, and the health of everything else. We apply our new understanding of Nature to achieve this. To achieve everything.

In the meantime, whether at work, or in community, or where ever, we collectively determine what is needed, and how to proceed with our transition. We know that we all need food, water, clothing, shelter, and purpose. We decide for ourselves, and relative to community, how we can best contribute. Whether it's agriculture, manufacturing, transportation, communications, shelter, health, security, or whatever. If it is determined that our current positions are no longer necessary, we seek out fellow evolved (community), and determine collectively, how we can best contribute.

We always seek to provide 'Love' and compassion, throughout. Because, what is good for fellow "evolved", is good for us. We must come together and solve all problems collectively. We do this with the new understanding of how Nature works. We use the entire Global population to seek to understand what is truly happening relative to the evolution of our World. For, things are changing, and will

continue to change. We must collectively be able to anticipate how it will change, and cause our collective evolution accordingly, so that we can survive. For, this is our journey.

As our transition succeeds, we develop new methods for the creation of relative joy.

We all participate in everything, and leave no one behind. As we develop new understanding of the workings of Nature, we share, and bring everyone on board. We evolve accordingly. We develop ideas for new dwellings that are efficient relative to a more community-oriented existence. We build new cities, new transportation systems, agriculture, new everything. We all learn the body and mind relative to new understanding, and become capable in providing aid relative to medical needs. We all teach and learn, and become capable throughout.

We accept that “emotion”, i. e. “fear”, “sadness”, “joy”, “love”, “lust”, even “anger”, etc. must remain an integral part of our continued evolution into the future, as we must have a continued reference to “Purpose”. However, we must eliminate the need for revenge. Therefore, those individuals who are in prisons, and who did not ask to be brought into such an evil World, must be brought in (with the rest of us), with open arms, and taught. Those with inherent violent tendencies must be looked after, closely. But, with compassion and forgiveness.

Sex:

We evolved to connect and be a part of someone else. Such a connection as sex does provide the ultimate reassurance of relative value. But, only through Natural connection. Anything else is fake reassurance (not real). The collective evolution of mankind, with its' increasing population has distorted and diluted the bond that such reassurance provides. For, values evolve. And, our values evolve relative to a collective 'dominant purpose' of competition. Therefore, we allow collective societal values to dictate our values.

Marriage is a man-made thing. It was imposed in order to generate familiarity, and relative stability in a competitive environment. That is not to say that mutual love cannot continue indefinitely.

We all, as brothers and sisters, have an obligation to ensure that no one is left behind. We must collectively do everything we can to provide a pathway to 'Love'.

However, we must all be true to ourselves, and be practical. We must consider what is best for individual, and community into the future. There can be no ownership. Any connection that is made and retained must be mutual. For, our objective is to create joy of life, and not misery. Emotion must come into play. But again, relative to our new 'dominant purpose'.

Note: It should "take a village to raise a child".

Religion:

Is it true that we have been wrong about everything? What I mean is; if we have been wrong about Nature (the vastness of the "Universe", "Light" traveling by wave, or particle, or both at 186,000 mile per second, filling 3-dimensional space as it goes, and continuing against opposing waves and particles from all directions, "atoms" with "electrons" flying around a "nucleus" which implies the presents empty space, telescopes with abilities to peer beyond our own "Eddies" without distortion, "spectroscopic analysis" for "carbon dating" which implies that aspects of Nature can exist through time unchanged, even in the presents of heat and pressure, Einstein's theories, which if challenged at the time with common sense, would never have left the ground), what else have we been wrong about?

Have we been wrong about allowing "Money" to set the tone for our existence? To allow a few wealthy and powerful (who know nothing of reality) to control the narrative for billions of others who continuously struggle just to keep up? What a waste! However, it does provide the wealthy and powerful an elevated sense of entitlement. We admire that. And, if we agree with that, it provides us (billions) a sense of purpose. Everything is right with the World, and we are on the right track.

What else have we been wrong about, and where does religion fit into all of this?

Religion does provide an alternative purpose within our current 'dominant purpose', which is based on competition. The word "alternative" is important here because it says that religion is not our dominant purpose. If it were our dominant purpose, we would have taken it seriously from its' beginning. Instead, we delude its' purpose, and reinterpret its' meaning so that it fits into our current 'dominant

purpose' of competition. Generally, religions convey a dominant message of "Love". Remember, anything that does not fall within the realm of current 'dominant purpose' must be rejected. For, it is impossible for 'love' to coexist with competition. We deceive ourselves as we perceive that they can coexist. We don't mind deceiving ourselves as long as we have others around us who agree with us.

I can neither confirm or deny the existence of a 'God'. However, assuming that a God exists in reality, it would serve nothing to confirm such existence. For, this is our journey. Therefore, it is up to us to screw it up, or to succeed!

It might seem unrealistic that a man could have created this explanation on his own. Even though, it is relatively simple, once you get onto the clue. However, it doesn't really matter. For, we are still on our own. It would be a mistake to assume that if we continuously screw up, something will always reach down and help us. Why? It is up to us now to take the roll of adult.

Our journey is to create the potential for survival into the future with great purpose and joy. To survive in spite of the continuously evolving "Universe". As we continue to survive, we continue to measure relative success accordingly, because it won't be easy. It is a collective, "all hands on deck" quest. For, we must compete with Nature.

In order to compete with Nature, we must learn it. Thoroughly! We learn it by continuously gathering and sharing information. We know that the 'Earth' is going to change, and become as the 'Moon'. We need to figure out how to survive through this. The 'Sun' is changing. Will there be another 'Eddy' with the potential for another Earth like environment? What would all of this mean to us into the future? How do we do our part to create the potential for life to continue well into the future, in spite of all else? This should be our purpose, and we will be remembered for it.

We should consider that we have opportunity here to evolve into great abilities to understand and manipulate Nature. For, our World is going to change. Our 'Eddy' will be used up, and our home will become similar to that of our 'Moon'. It is possible that a new 'Eddy' will form, with the potential for a new World. We should proceed as though such a possibility is real. We should cause our own

future evolution to have some influence over such a possibility. For, it is all about the journey of life. Life with purpose. There is no reason for us to allow foolishness to end our collective journey.

We are here. Who's to say that such a journey has not occurred before, and continues.

The fragility of emotion will cause us to question the reality of this, and what it means to us. Therefore, we must seek out neighbors, friends, co-workers, family, community, anyone, to ensure that we are on the same page. There, we can find reassurance. We must seek out those in need, and reassure. Then, we consider how we can make this happen, collectively, and relative to this explanation. Let's have some fun.
